

The Enigmatic Machine [SOMEWHAT OF A SOL. DOC]

These repeat transmissions seem to add up... but I could only get the first letter so far.

PLEASE REFER TO THE LOEVINGER DOC FOR A MACHINE-BY-MACHINE RUN-THRU

RED = #FF0000

BLUE = #0047AB

All colors can be double-checked or double-dipped for accuracy with www.colorhexa.com

All sites are lowercase

THE MECHANISM OF THE FUNCTION:

THE PUZZLE IS ALL ABOUT FIGURING OUT HOW TO BACKSOLVE THIS IMAGINARY FUNCTION BOX WHICH IS SHOWN IN 3 INITIAL EXAMPLES. *The function described shifts the top letters by a sequentially increasing amount.* THE “**LEFT-FACING FUNCTION**” starts the shift from the left and works right, and the “**RIGHT-FACING FUNCTION**” does the opposite. The **ARROW COLOR** showcases the initial value of the shift, which increases in a Fibonacci sequence.

EACH LETTER IS COUNTED AS A SEPARATE DIGIT. ANY OVERFLOW IS TREATED TO THE MOD. OF THAT COUNTING SYSTEM (26 for letters, 10 for nums) (* for examples)

WHEN IT COMES DOWN TO IT, FOR ANY LETTER OR NUMBER **A** (in an input of **n** values), THE (red arrow)

DOUBLE FUNCTION = $[2(A) + (n+1)] \% 10$ (or $\% 26$ in context of letters)

TO EXPLAIN THE HEX COLORS:

Each color is gotten as a fibonacci addition of the two seed colors, red and blue on www.colorhexa.com

Something that will be a common mis-step for the puzzlers: **the hexadecimal code is just to keep track of the exact color value to make sure you know that it is truly Fibonacci.** The only time the color code is needed to solve the puzzle is on the later website bit where it blatantly asks for the question mark's color code.

What the colors do though is alter the equation's initial shift by an increasing Fibonacci amount:

EXAMPLES OF DIFF. ARROW COLORS:

IN THE END.... Imo best way to think about the function

DOUBLE FUNCTION = $[2(A) + (n+1)+2F(n)] \%10$ (or $\%26$ in context of letters)

NOW ... TO BACKSOLVE!!!!

EACH LETTER ON THE BOTTOM GIVES 2 POSSIBLE LETTERS UPSTAIRS DUE TO A +26/+10 MOD SHIFT

EUREKA THE CONSTANT IS 31415

➔ *Pi is the “constant” from the Eureka repeats. This is just to prove that they know how to backsolve*

www.peapuzzlehunt.com/enigma-pi

➔ *? color is #543075. This is just to prove that they know how to fib. Add the colors*

www.peapuzzlehunt.com/enigma-543075

Bingo! This seems to be the final layer of encryption...

www.peapuzzlehunt.com/enigma-??????

<- A translated note from a German official:
"It either rhymes with Führer or is part of the
name of a Beatles song... I forget which"

➔ **Now the final puzzle. A specific backsolve for the color right before the question mark color.** The answer of what is a real word is purposely hard, and, miraculously, ABJURER and NOWHERE both work!! (hinted by the side note)
